

Lab Support

Laboratories use BioData to:

- Download information (i.e. LabOrders) about the samples that are sent to them for processing
- Upload laboratory results
- Obtain information needed to prepare result data sets that conform to BioData requirements

This page provides access to information for laboratories that will be delivering (uploading) taxonomic identification and enumeration results to BioData. It provides access to information about how laboratories use BioData, the data that laboratories download to support sample processing, and requirements for result data sets that laboratories upload to the System.
